Accelerating Applications with CUDA C/C++

TOPICS

GPU-accelerated vs. CPU-only Applications

CUDA Kernel Execution

Parallel Memory Access

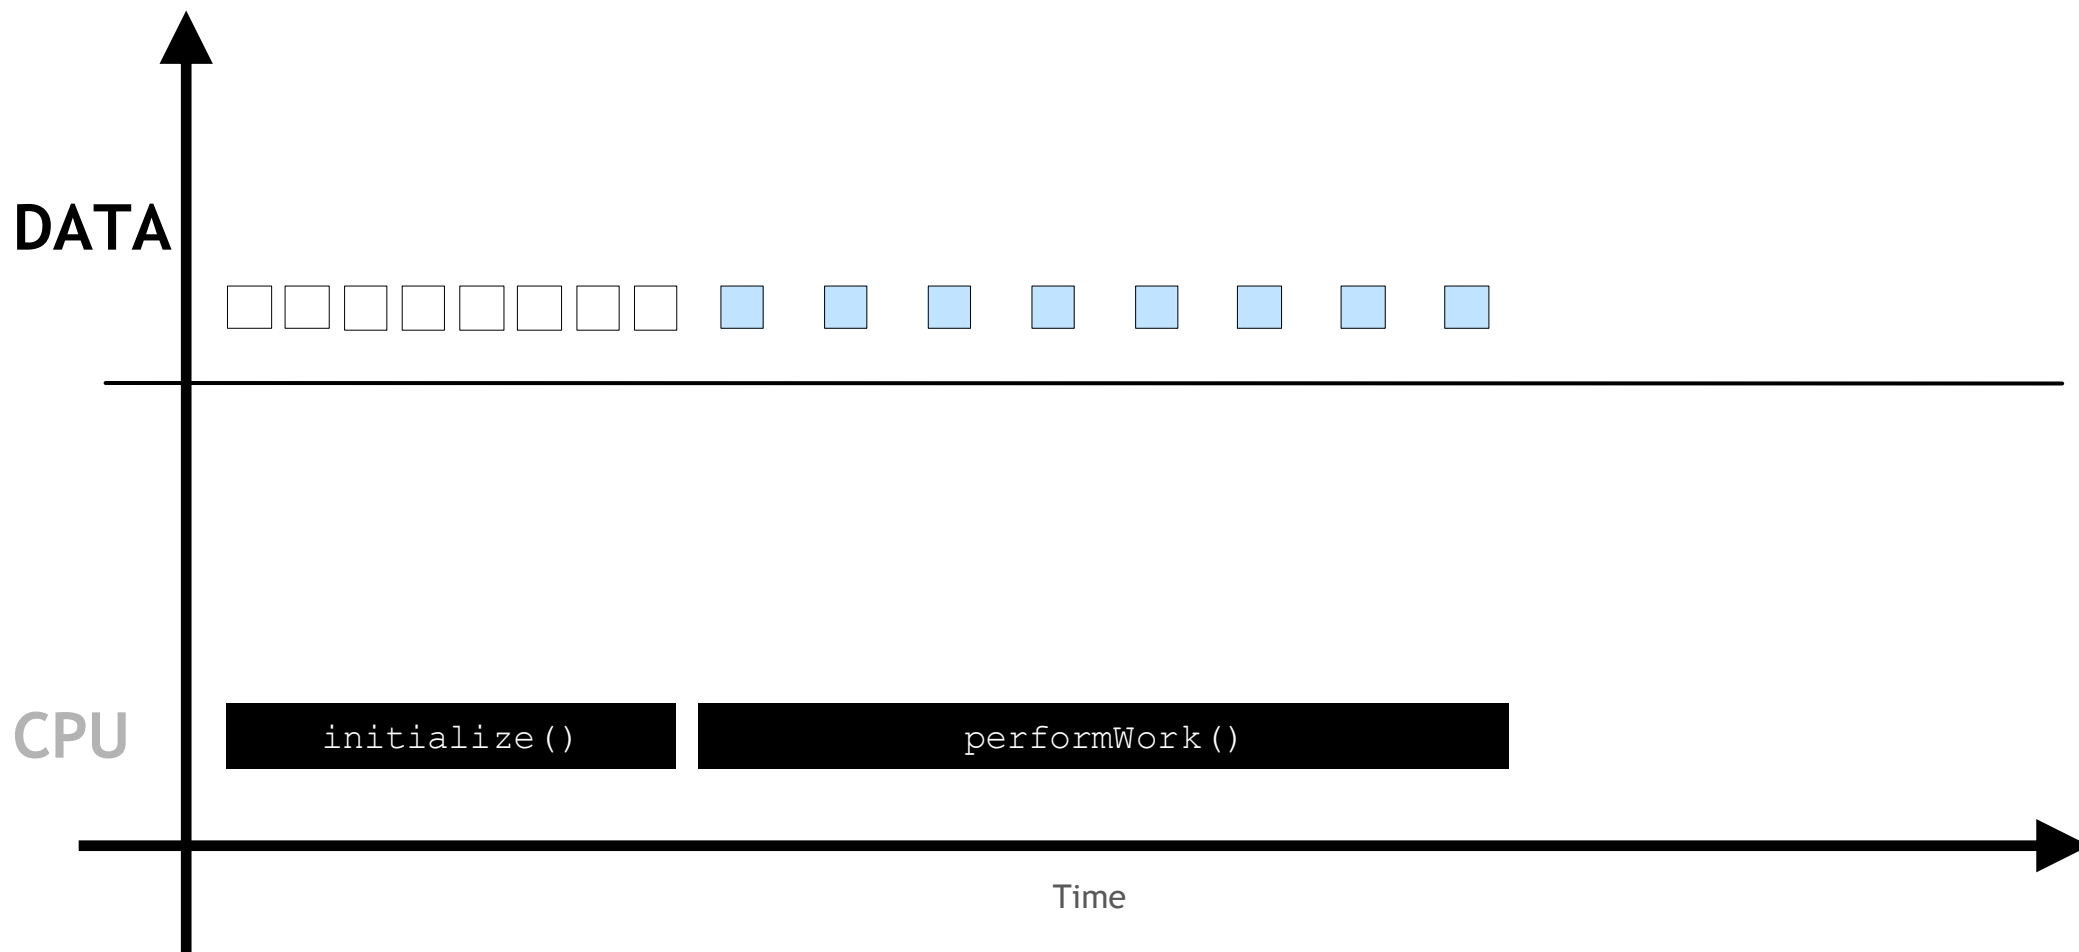

Appendix: Glossary

GPU-accelerated vs. CPU-only Applications

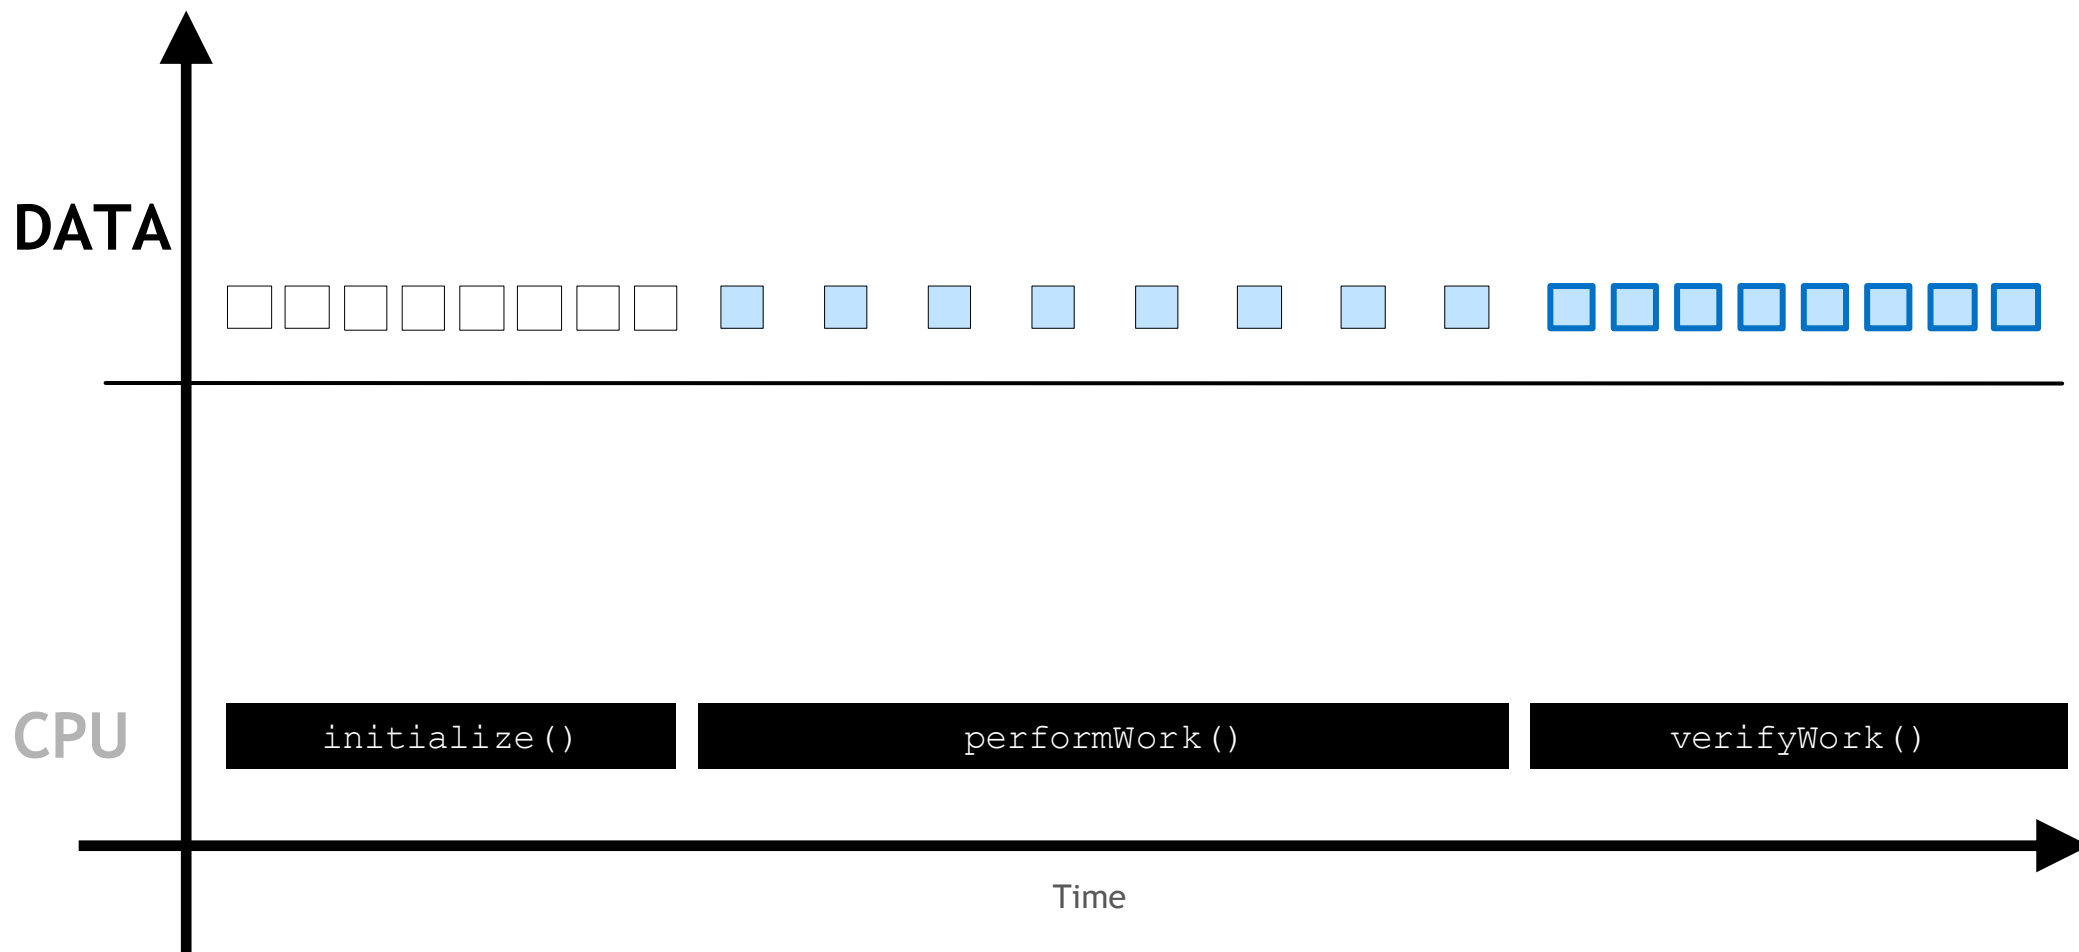

In **CPU-only applications** data is allocated on CPU

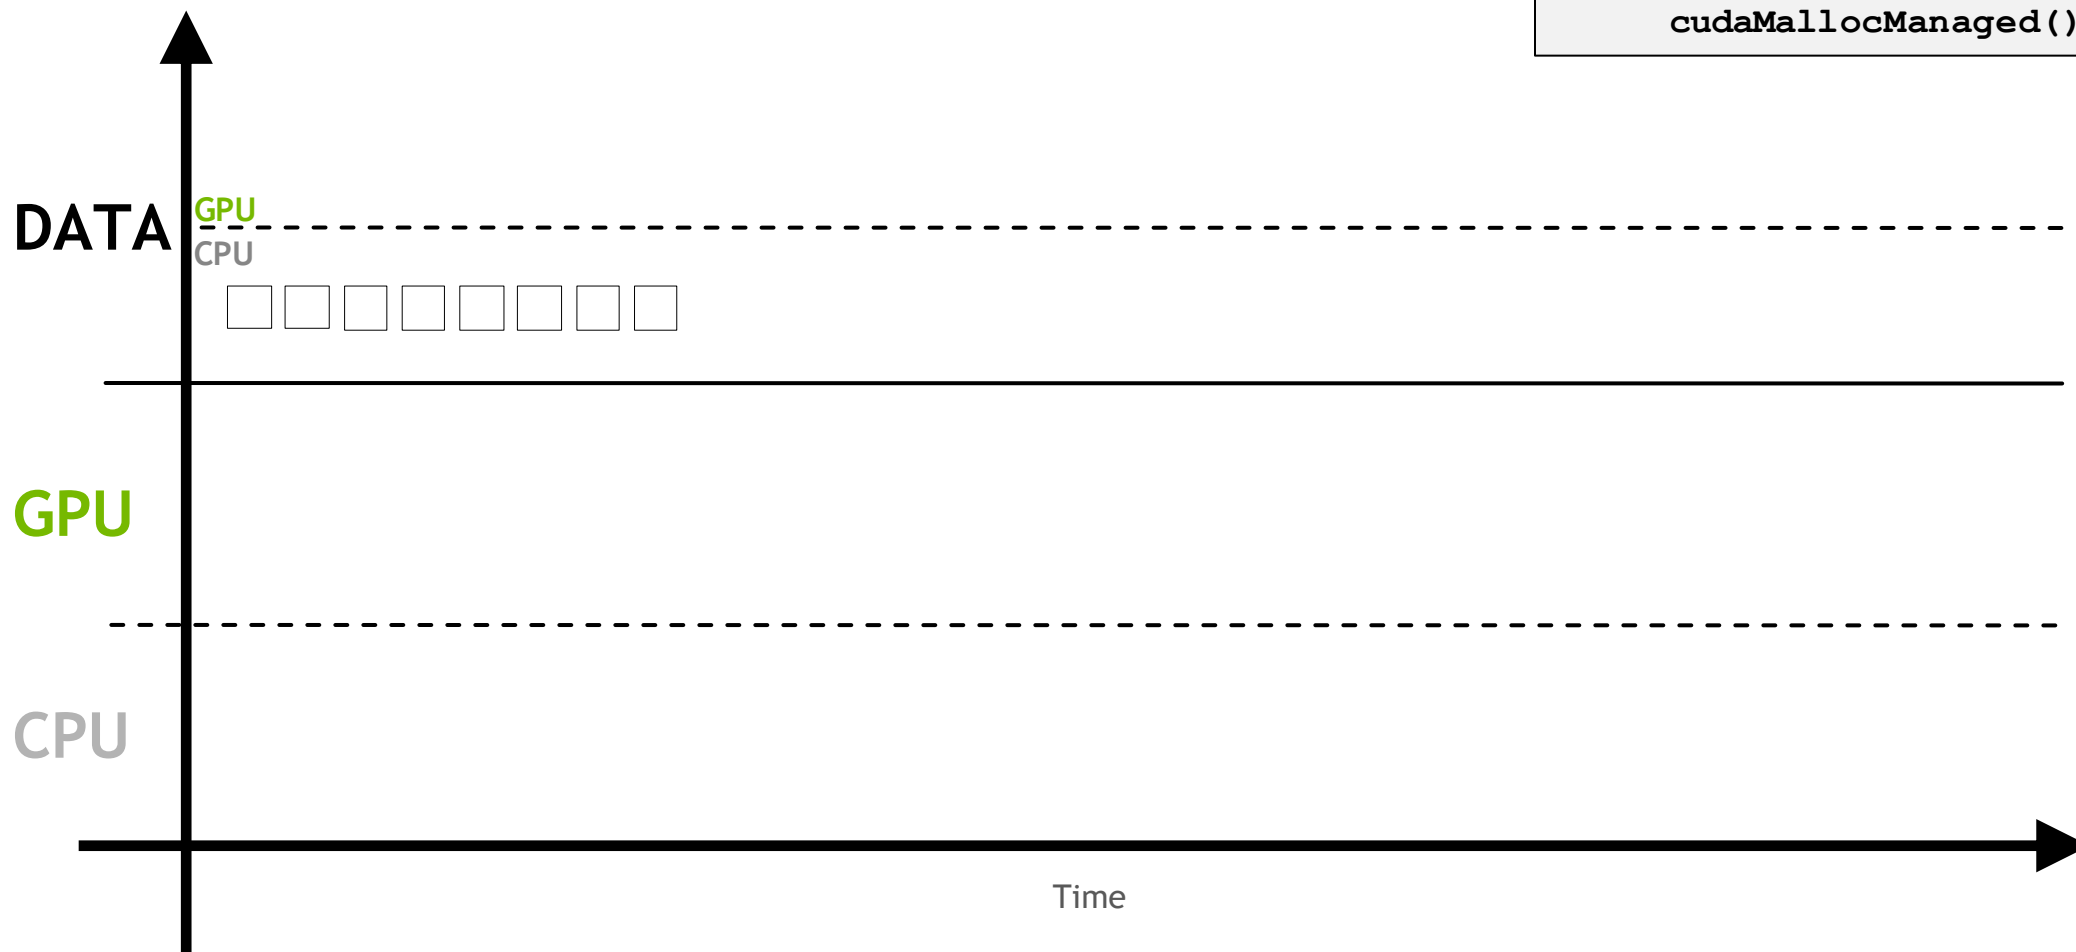

...and all work is performed on CPU

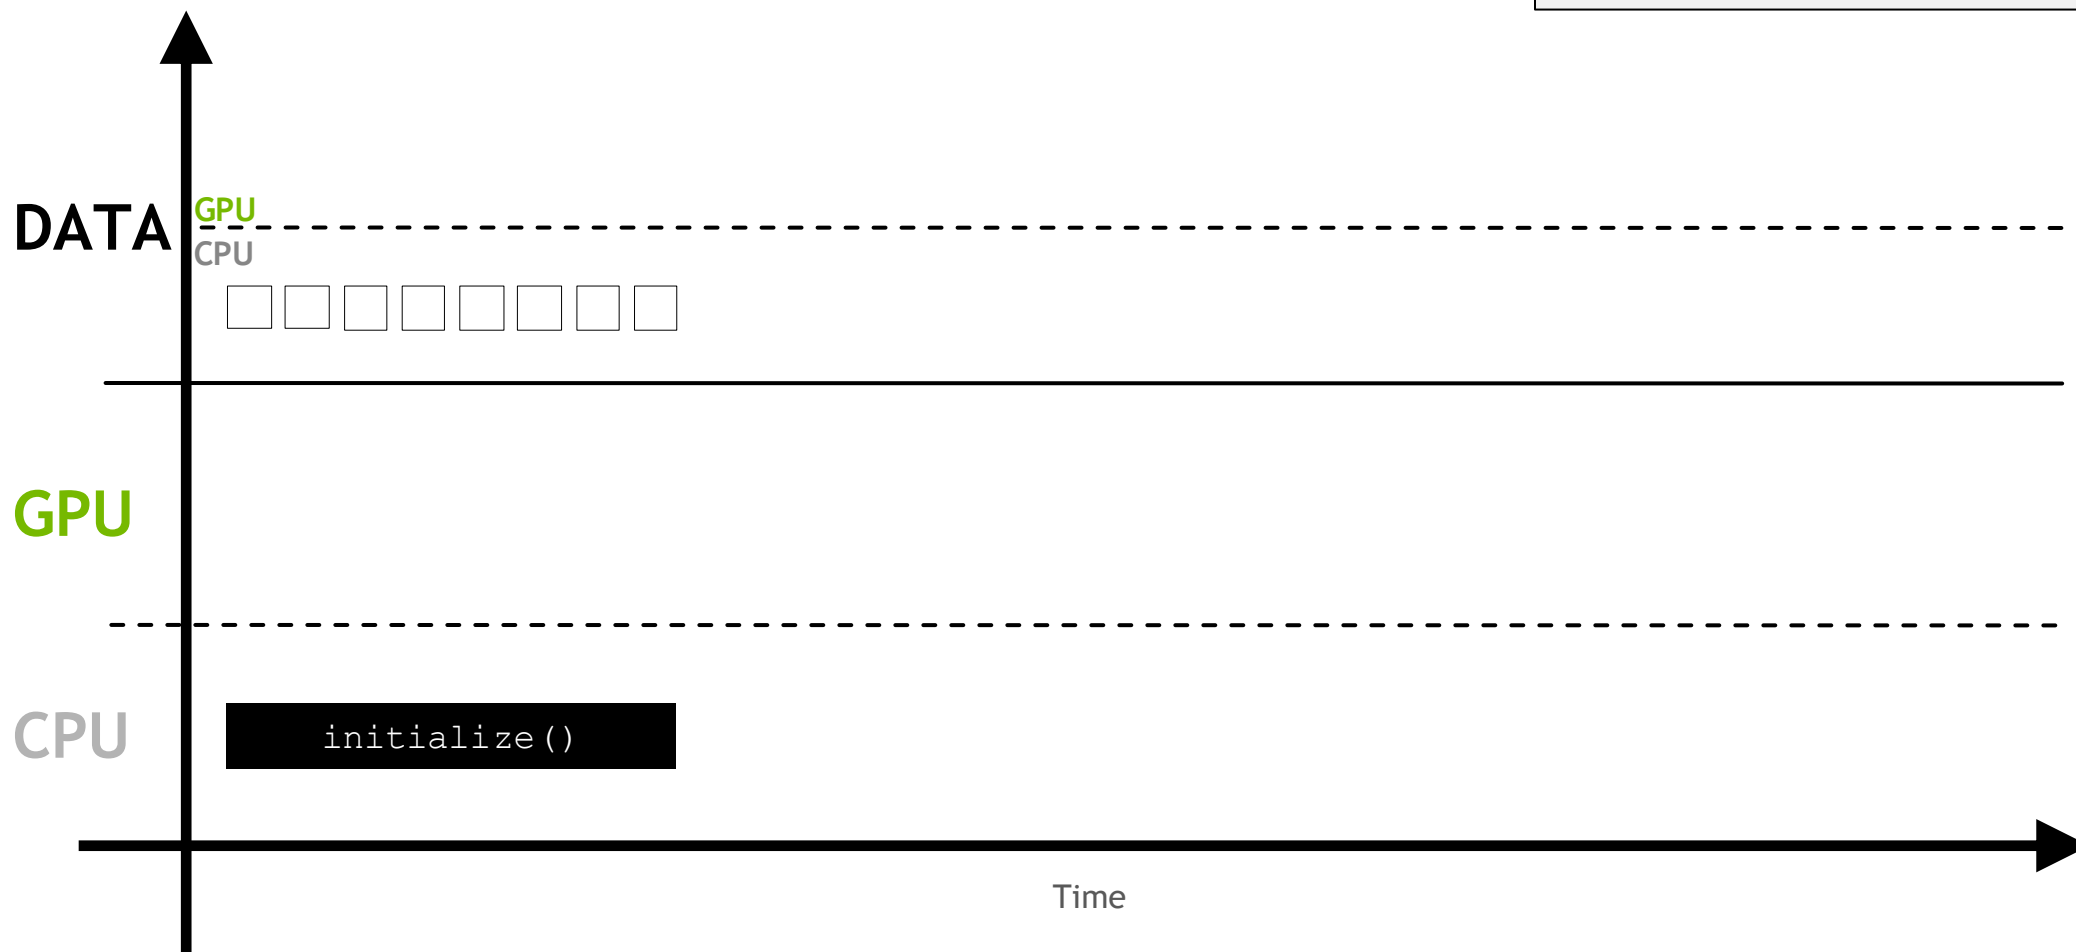

...and all work is performed on CPU

In **accelerated applications** data is
allocated with
`cudaMallocManaged()`

... where it can be accessed and worked on by the CPU

DATA

GPU
CPU

GPU

`performWork()`

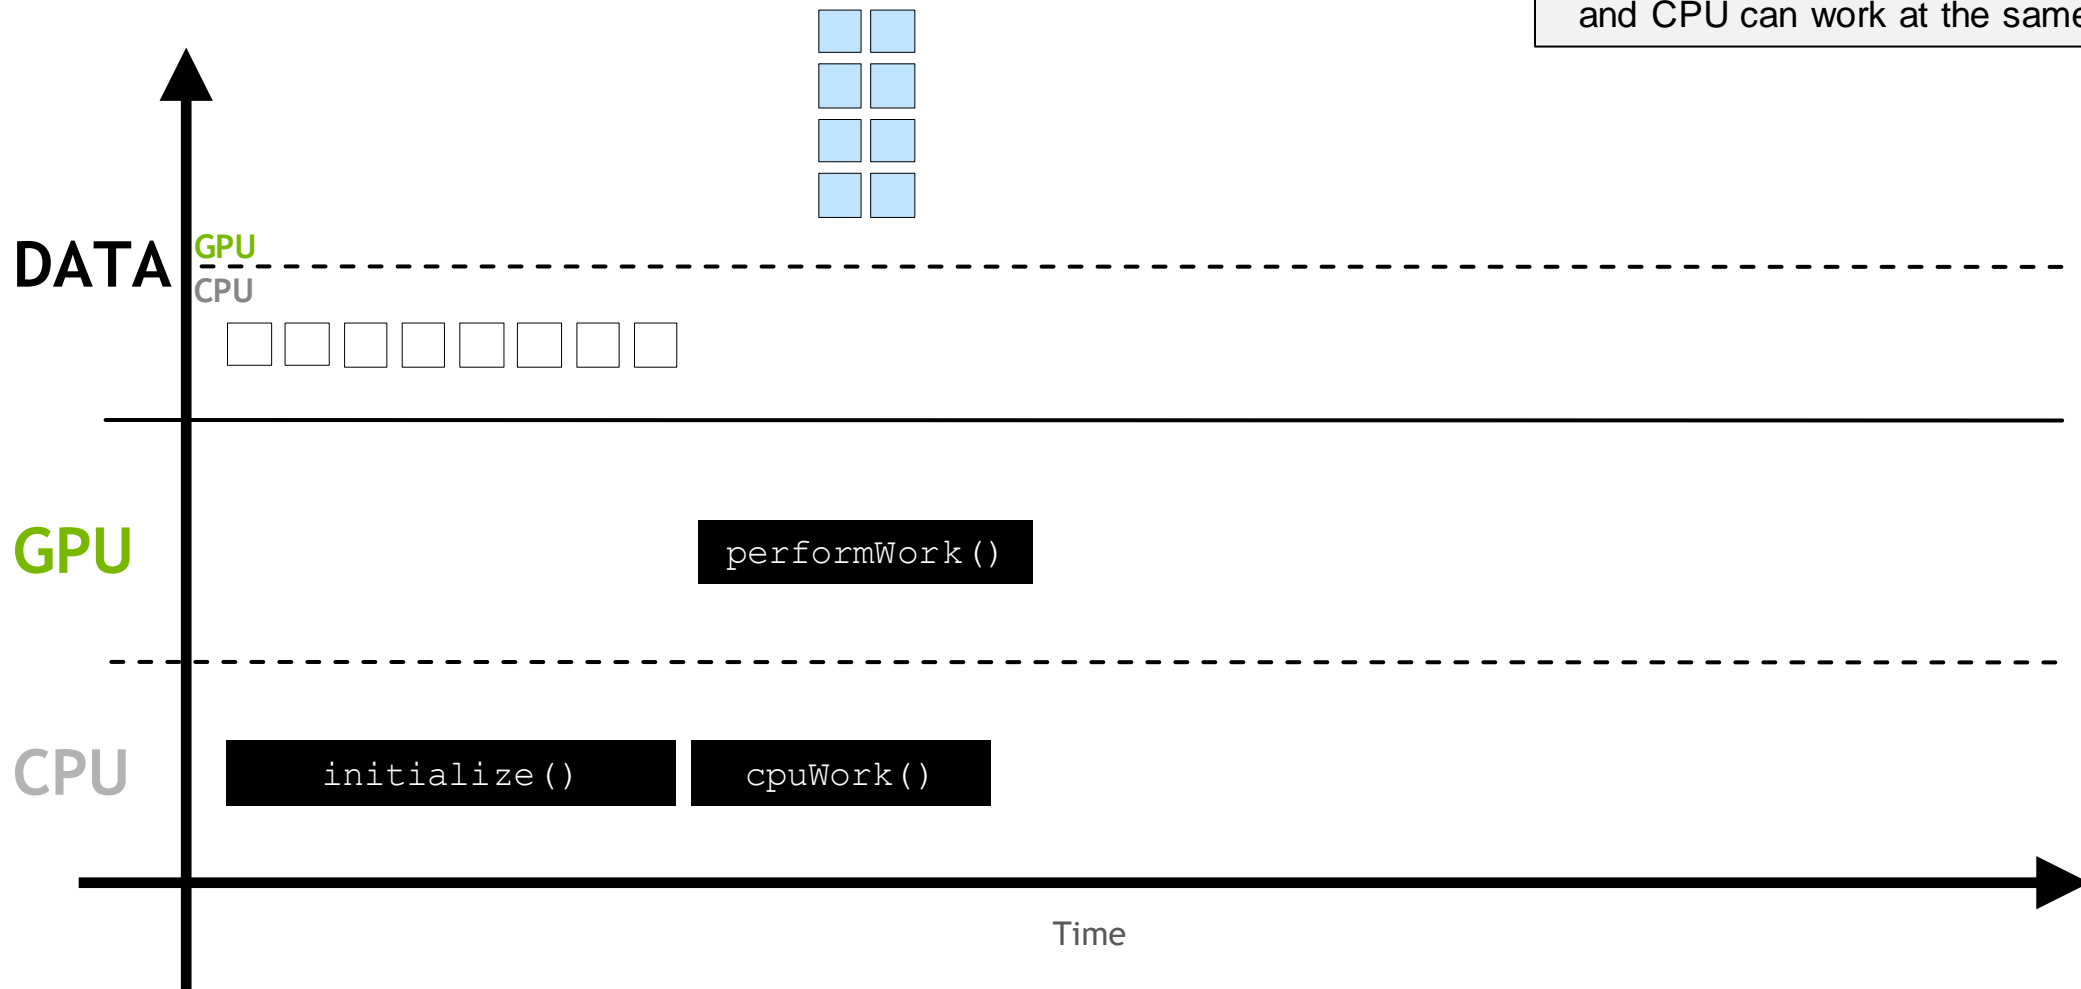

CPU

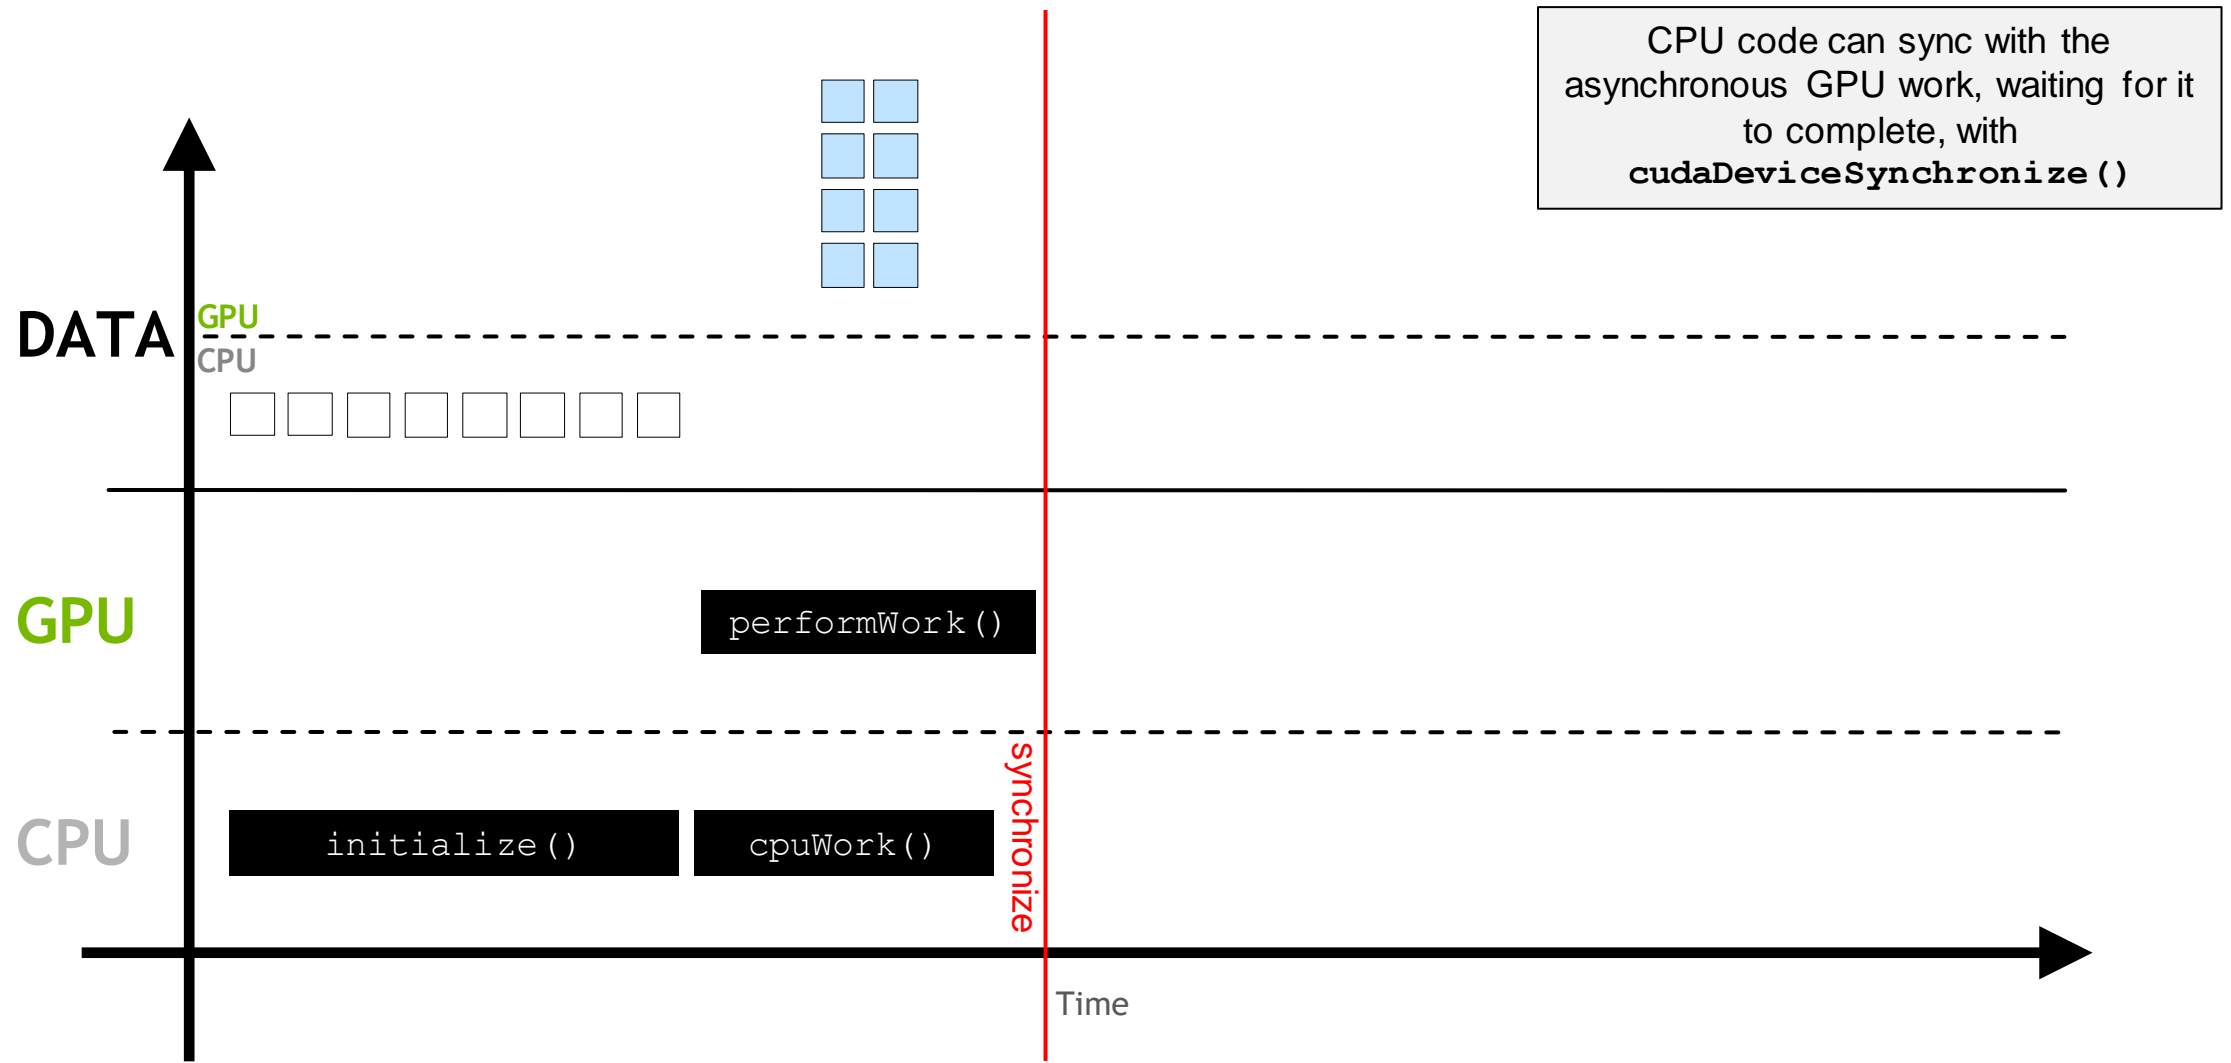

`initialize()`

Time

... and automatically migrated to the GPU where parallel work can be done

Work on the GPU is **asynchronous**,
and CPU can work at the same time

DATA

GPU
CPU

GPU

`performWork()`

CPU

`initialize()`

`cpuWork()`

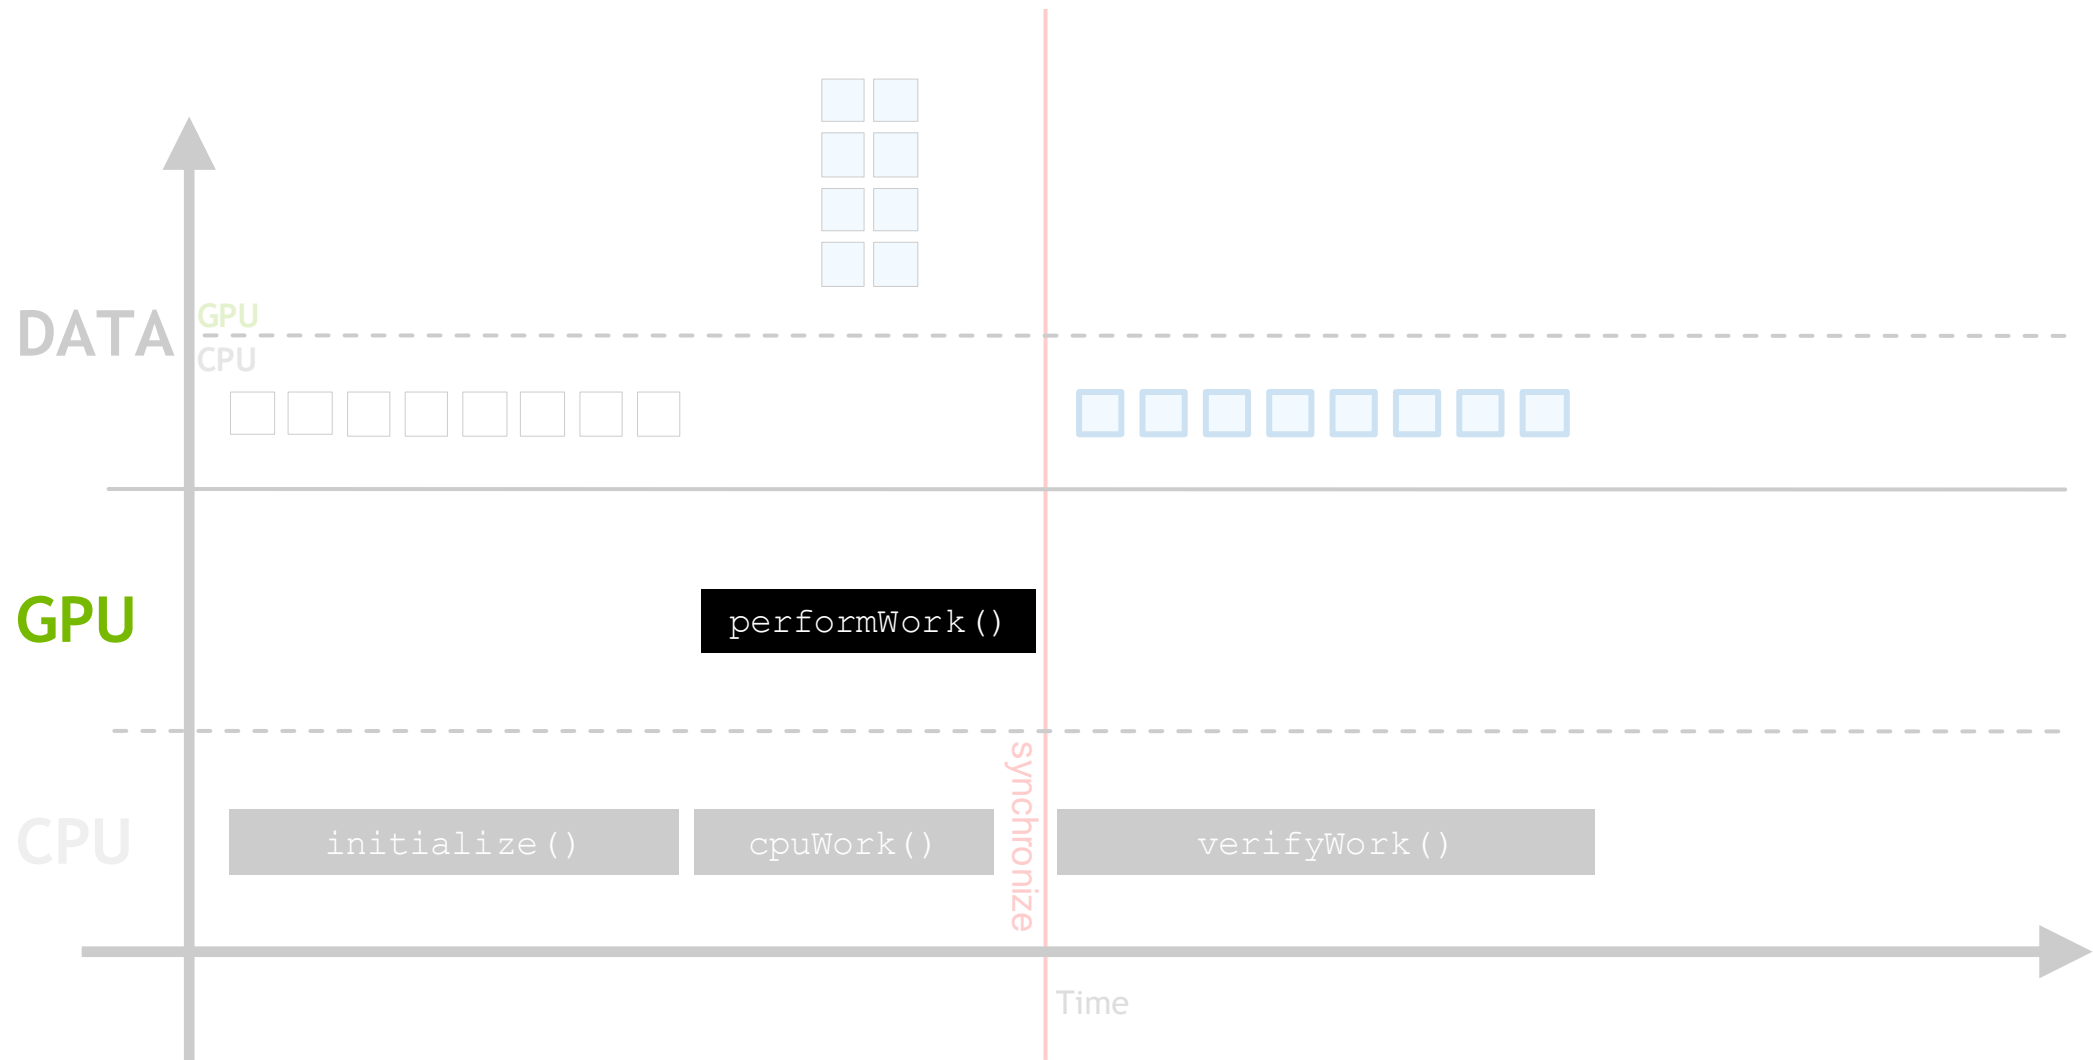

`verifyWork()`

synchronize

Time

... data accesses by the CPU will
automatically be migrated

CUDA Kernel Execution

GPU

GPU work is done in a **thread**

GPU

Many threads run in parallel

GPU

```
performWork<<<2, 4>>>()
```

A collection of threads is a **block**

GPU

There are many blocks

GPU

A collection of blocks is a **grid**

GPU

GPU

```
performWork<<<2, 4>>>()
```

Kernels are **launched** with an
execution configuration

GPU

```
performWork<<<2, 4>>>()
```

The execution configuration defines
the number of blocks in the grid

GPU

```
performWork<<<2, 4>>>()
```

... as well as the number of threads in each block

GPU

Every block in the grid contains the same number of threads

GPU

CUDA-Provided Thread Hierarchy Variables

Inside kernels definitions, CUDA-provided variables describe its executing thread, block, and grid

GPU

```
performWork<<<2, 4>>>()
```

`gridDim.x` is the number of blocks in the grid, in this case 2

GPU

`blockIdx.x` is the index of the current block within the grid, in this case 0

GPU

`blockIdx.x` is the index of the current block within the grid, in this case 1

GPU

Inside a kernel `blockDim.x` describes the number of threads in a block. In this case 4

GPU

All blocks in a grid contain the same number of threads

GPU

Inside a kernel `threadIdx.x`
describes the index of the thread within
a block. In this case 0

GPU

Inside a kernel `threadIdx.x`
describes the index of the thread within
a block. In this case 1

GPU

Inside a kernel `threadIdx.x`
describes the index of the thread within
a block. In this case 2

GPU

Inside a kernel `threadIdx.x`
describes the index of the thread within
a block. In this case 3

GPU

Inside a kernel `threadIdx.x`
describes the index of the thread within
a block. In this case 0

GPU

Inside a kernel `threadIdx.x`
describes the index of the thread within
a block. In this case 1

GPU

Inside a kernel `threadIdx.x`
describes the index of the thread within
a block. In this case 2

GPU

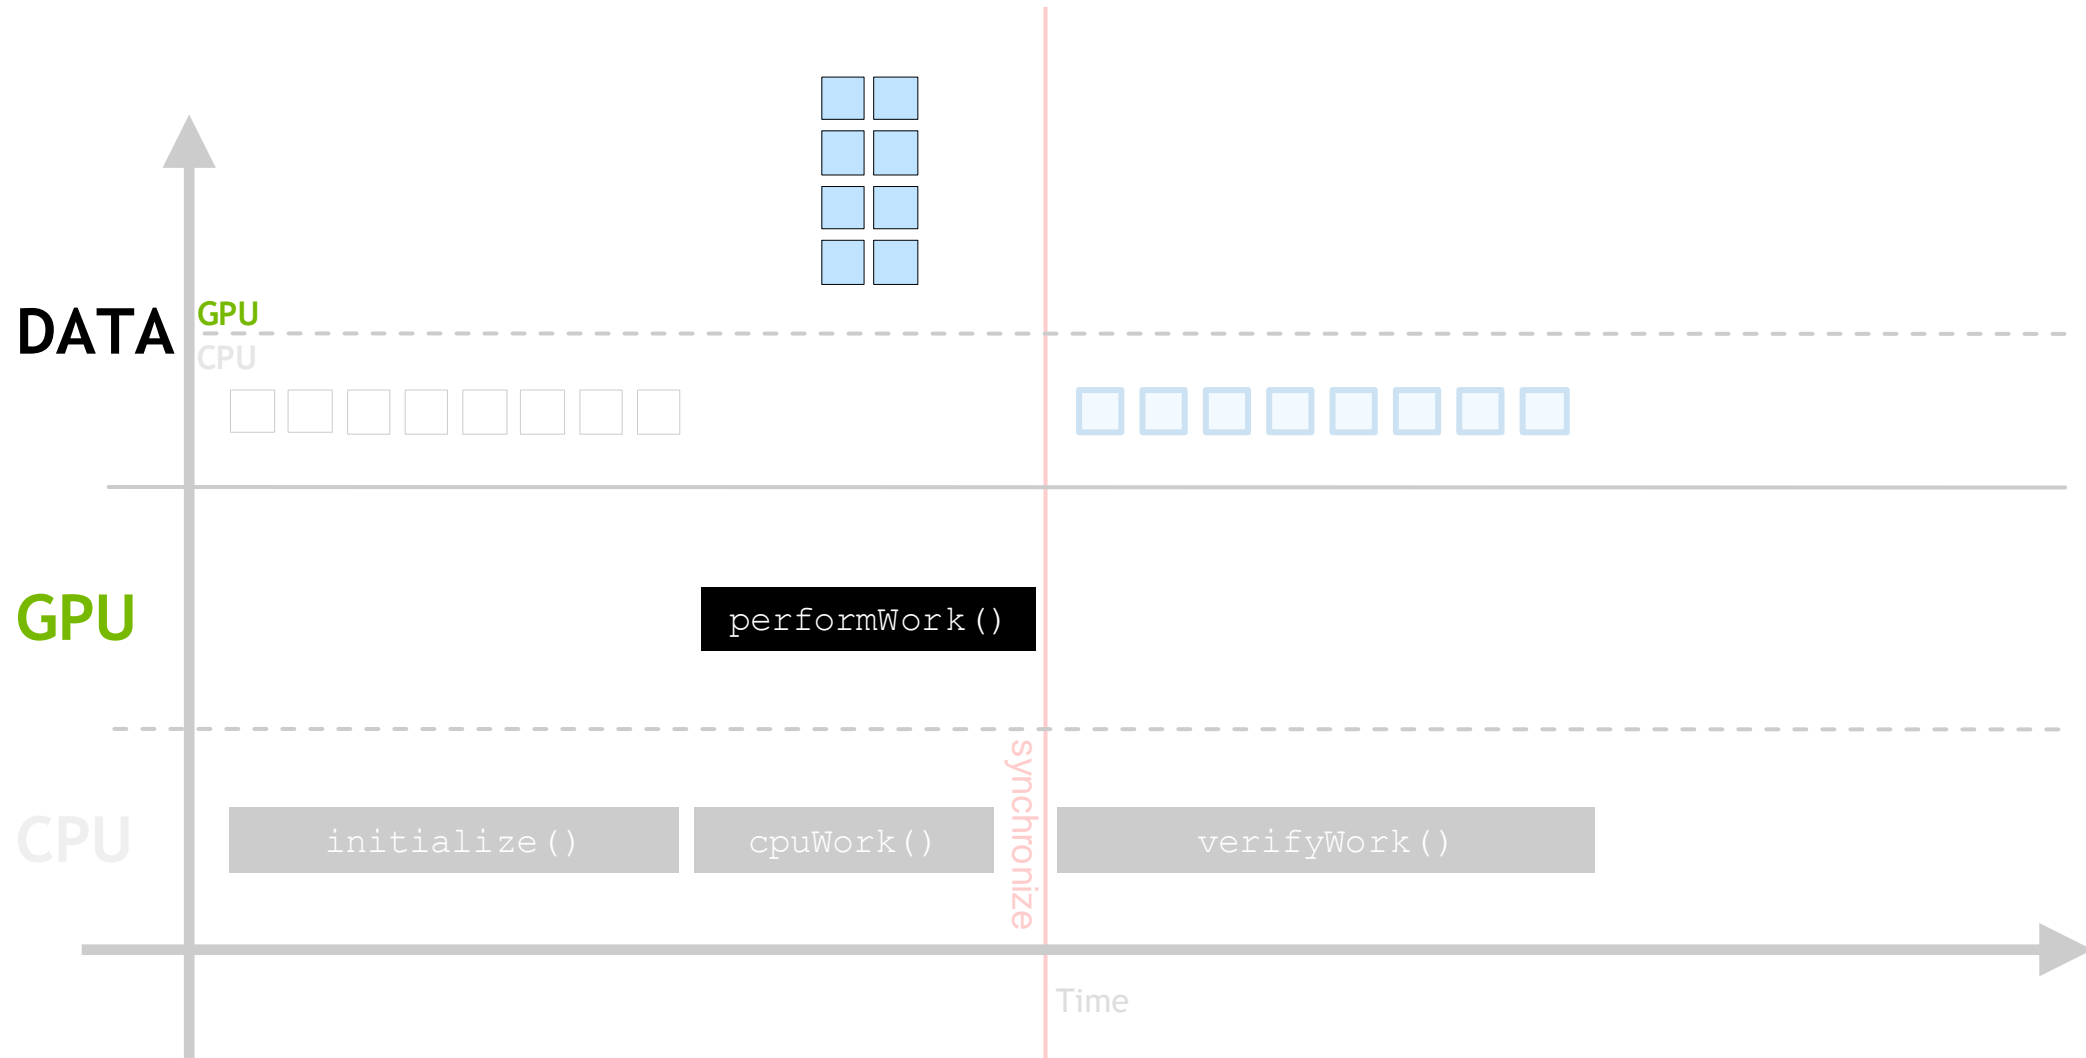

Inside a kernel `threadIdx.x`
describes the index of the thread within
a block. In this case 3

GPU

Coordinating Parallel Threads

GPU
DATA

Assume data is in a 0 indexed vector

GPU

```
performWork<<<2, 4>>>()
```

GPU DATA

0	4
1	5
2	6
3	7

Assume data is in a 0 indexed vector

GPU

```
performWork<<<2, 4>>>()
```

GPU
DATA

Somehow, each thread must be mapped to work on an element in the vector

GPU

```
performWork<<<2, 4>>>()
```

GPU DATA

0	4
1	5
2	6
3	7

Recall that each thread has access to the size of its block via `blockDim.x`

GPU

```
performWork<<<2, 4>>>()
```

GPU DATA

0	4
1	5
2	6
3	7

...and the index of its block within the grid via `blockIdx.x`

GPU

GPU DATA

0	4
1	5
2	6
3	7

...and its own index within its block via
`threadIdx.x`

GPU

GPU DATA

0	4
1	5
2	6
3	7

Using these variables, the formula
`threadIdx.x + blockIdx.x *
blockDim.x` will map each thread to
one element in the vector

GPU

Grid Size Work Amount Mismatch

GPU
DATA

In previous scenarios, the number of threads in the grid matched the number of elements exactly

GPU

GPU DATA

What if there are more threads than work to be done?

GPU

GPU DATA

Attempting to access non-existent elements can result in a runtime error

GPU

GPU DATA

0	4
1	×
2	×
3	×

Code must check that the `dataIndex` calculated by `threadIdx.x + blockIdx.x * blockDim.x` is less than `N`, the number of data elements.

GPU

GPU DATA

threadIdx.x	+	blockIdx.x	*	blockDim.x
0		1		4

dataIndex	<	N	=	Can work
4		5		?

GPU

GPU DATA

threadIdx.x	+	blockIdx.x	*	blockDim.x
0		1		4

dataIndex	<	N	=	Can work
4		5		true

GPU

GPU DATA

threadIdx.x	+	blockIdx.x	*	blockDim.x
1		1		4

dataIndex	<	N	=	Can work
5		5		?

GPU

GPU DATA

threadIdx.x	+	blockIdx.x	*	blockDim.x
1		1		4

dataIndex	<	N	=	Can work
5		5		false

GPU

GPU DATA

threadIdx.x	+	blockIdx.x	*	blockDim.x
2		1		4

dataIndex	<	N	=	Can work
6		5		?

GPU

GPU DATA

threadIdx.x	+	blockIdx.x	*	blockDim.x
2		1		4

dataIndex	<	N	=	Can work
6		5		false

GPU

GPU DATA

threadIdx.x	+	blockIdx.x	*	blockDim.x
2		1		4

dataIndex	<	N	=	Can work
6		5		?

GPU

GPU DATA

threadIdx.x	+	blockIdx.x	*	blockDim.x
2		1		4

dataIndex	<	N	=	Can work
6		5		false

GPU

Grid-Stride Loops

GPU DATA

0	4	8	12	16	20	24	28
1	5	9	13	17	21	25	29
2	6	10	14	18	22	26	30
3	7	11	15	19	23	27	31

Often there are more data elements than there are threads in the grid

GPU

GPU
DATA

0	4	8	12	16	20	24	28
1	5	9	13	17	21	25	29
2	6	10	14	18	22	26	30
3	7	11	15	19	23	27	31

In such scenarios threads
cannot work on only one
element

GPU

GPU DATA

0	4	8	12	16	20	24	28
1	5	9	13	17	21	25	29
2	6	10	14	18	22	26	30
3	7	11	15	19	23	27	31

... or else work is left
undone

GPU

```
performWork<<<2, 4>>>()
```

GPU DATA

0	4	8	12	16	20	24	28
1	5	9	13	17	21	25	29
2	6	10	14	18	22	26	30
3	7	11	15	19	23	27	31

One way to address this
programmatically is with a
grid-stride loop

GPU

GPU DATA

0	4	8	12	16	20	24	28
1	5	9	13	17	21	25	29
2	6	10	14	18	22	26	30
3	7	11	15	19	23	27	31

In a grid-stride loop, the thread's first element is calculated as usual, with
`threadIdx.x +`
`blockIdx.x *`
`blockDim.x`

GPU

GPU DATA

0	4	8	12	16	20	24	28
1	5	9	13	17	21	25	29
2	6	10	14	18	22	26	30
3	7	11	15	19	23	27	31

The thread then strides forward by the number of threads in the grid
(`blockDim.x * gridDim.x`), in this case
8

GPU

GPU DATA

0	4	8	12	16	20	24	28
1	5	9	13	17	21	25	29
2	6	10	14	18	22	26	30
3	7	11	15	19	23	27	31

It continues in this way until its data index is greater than the number of data elements

GPU

GPU DATA

0	4	8	12	16	20	24	28
1	5	9	13	17	21	25	29
2	6	10	14	18	22	26	30
3	7	11	15	19	23	27	31

It continues in this way until its data index is greater than the number of data elements

GPU

GPU DATA

0	4	8	12	16	20	24	28
1	5	9	13	17	21	25	29
2	6	10	14	18	22	26	30
3	7	11	15	19	23	27	31

With all threads working in this way, all elements are covered

GPU

```
performWork<<<2, 4>>>()
```

GPU
DATA

0	4	8	12	16	20	24	28
1	5	9	13	17	21	25	29
2	6	10	14	18	22	26	30
3	7	11	15	19	23	27	31

With all threads working in
this way, all elements are
covered

GPU

3	7	11	15	19	23	27	31

With all threads working in this way, all elements are covered

GPU

```
performWork<<<2, 4>>>()
```

CUDA runs as many blocks
in parallel at once as the
GPU hardware supports, for
massive parallelization

Glossary

Glossary

- **cudaMallocManaged()**: CUDA function to allocate memory accessible by both the CPU and GPUs. Memory allocated this way is called *unified memory* and is automatically migrated between the CPU and GPUs as needed.
- **cudaDeviceSynchronize()**: CUDA function that will cause the CPU to wait until the GPU is finished working.
- **Kernel**: A CUDA function executed on a GPU.
- **Thread**: The unit of execution for CUDA kernels.
- **Block**: A collection of threads.
- **Grid**: A collection of blocks.
- **Execution context**: Special arguments given to CUDA kernels when launched using the `<<<...>>>` syntax. It defines the number of blocks in the grid, as well as the number of threads in each block.
- **gridDim.x**: CUDA variable available inside executing kernel that gives the number of blocks in the grid
- **blockDim.x**: CUDA variable available inside executing kernel that gives the number of threads in the thread's block
- **blockIdx.x**: CUDA variable available inside executing kernel that gives the index the thread's block within the grid
- **threadIdx.x**: CUDA variable available inside executing kernel that gives the index the thread within the block
- **threadIdx.x + blockIdx.x * blockDim.x**: Common CUDA technique to map a thread to a data element
- **Grid-stride loop**: A technique for assigning a thread more than one data element to work on when there are more elements than the number of threads in the grid. The stride is calculated by **gridDim.x * blockDim.x**, which is the number of threads in the grid.
